

Maintaining Coherence of a Running Lisp

- Drew McDermott
 - Yale University
Computer Science Department

What is (In)coherence?

Suppose a table is created in one file, and added to in files loaded later.

If the original file is reloaded, we have lost **coherence**.

Basic Idea is Obvious

Chunks

C1 & C2 are the basis of C3, which is their derivative.

C3 can be brought up to date when C1 and C2 are up to date.

What is a Chunk?

- A piece of information, or a piece in a particular place or state, or....
- Generic function `derive` brings chunk up to date.
- Acyclic derivation graph
- Chunks are “big” (not spreadsheet cells)

Complexities

- There can be more than one chunk from which a higher chunk can be derived.
- Some bases are needed only for derivation to occur.
- Chunk deriviers can alter the chunk network.

“Being Managed”

Chunk C is **managed**

=

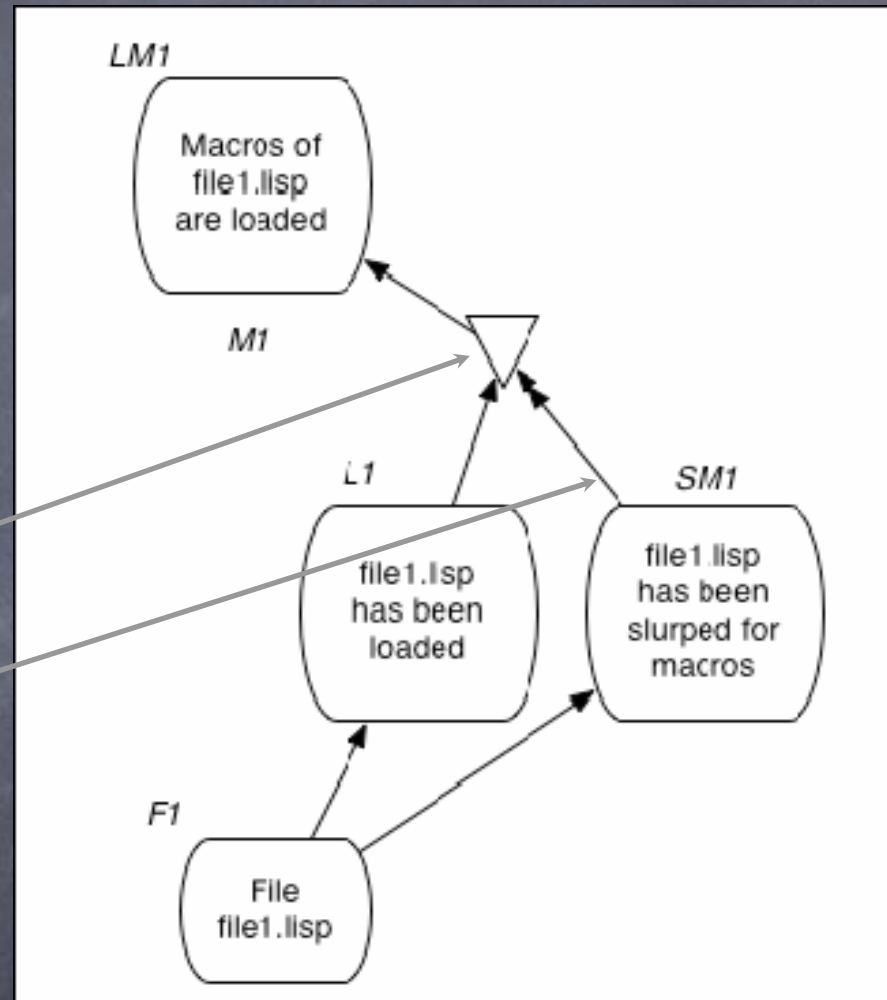

system commits to
keeping C up to date.

Disjunctive Basis

You don't need to compile or load file1.lisp to extract macros from it.

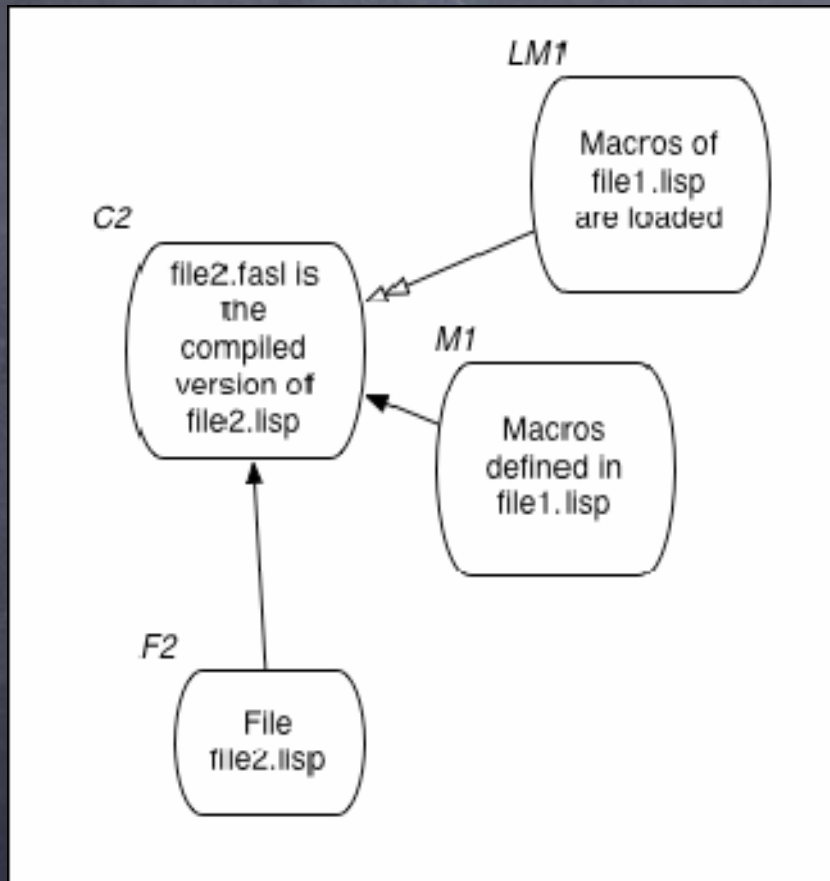

OR

default

SM1 should be managed if L1 isn't

Derive Basis

Macros (LM1) don't have to be loaded for C2 to be up to date; they just have to be loaded for C2 to be brought up to date.

Chunks Changing Chunk Network

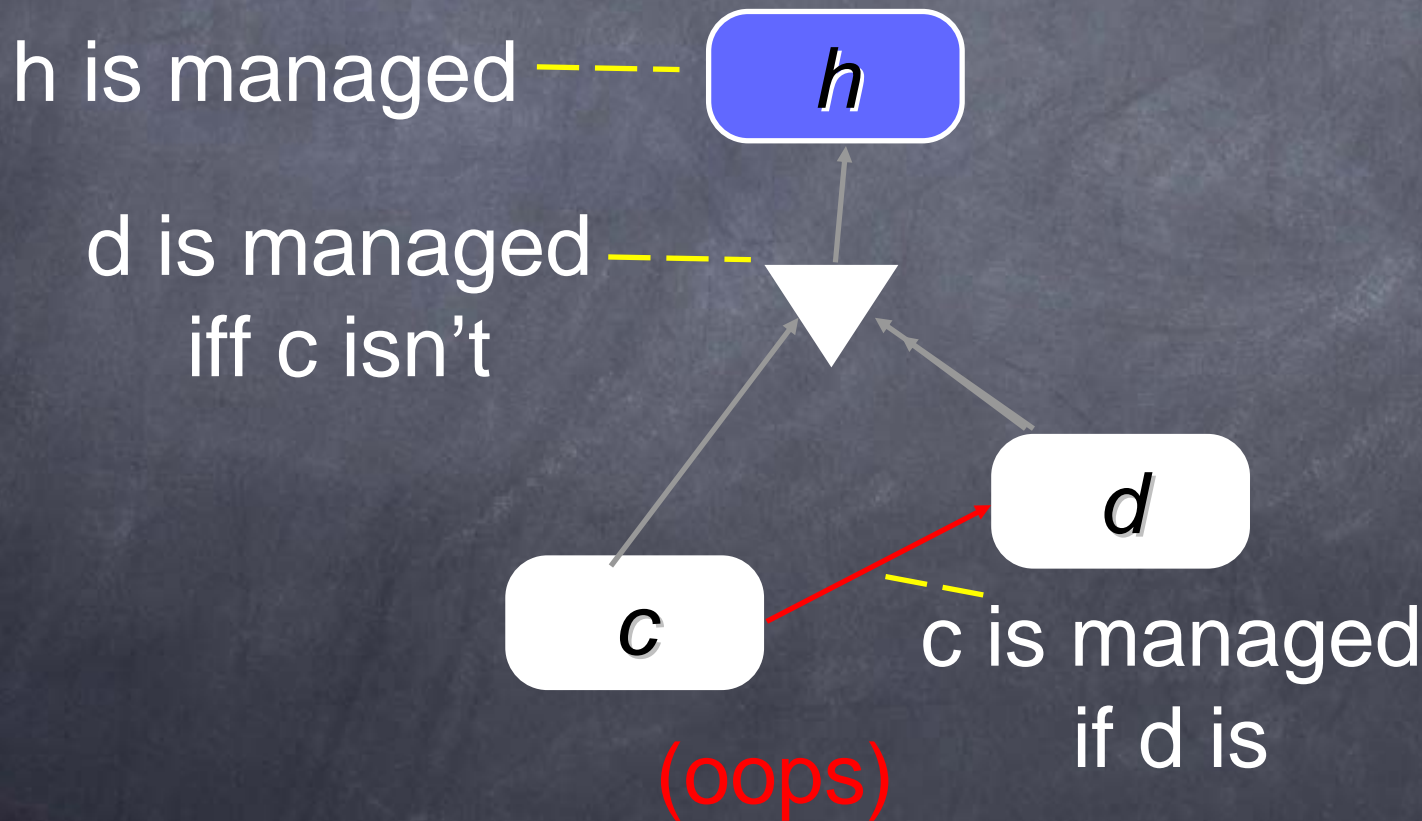

YTools File Manager (YTFM) reads file headers to get dependencies:

```
(depends-on %hacks/ fileseg)
```

changes derives of `fileseg` chunk

Alg.1: Manage/Unmanage

Alg. 2: chunks-update

- The basic idea is what you would expect: find supporters and derivants of chunks, and call their derivers if they are out of date.
- But there are a lot of complexities . . .
..

Complexities

- If a chunk must be updated, its update-basis must be temporarily managed (alg. 1 called during alg. 2).
- If a “rogue” chunks-update occurs, we restart the current one.
- Saving grace: A given chunk’s deriver is called at most once, even across restarts.

But it's hard to guarantee (or define) correctness

Conclusions

- YTFM completely rewritten (after years of kludgy patches) using chunk system. Now it works.
- The system has the “right” tool set --- lots of ramifications to explore.
- Available (well, soon), from <http://www.cs.yale.edu/homes/dvm>
Look for YTools 2.0
